We created a device that provides music enthusiasts a seamless way to enjoy both a musical and visual experience without adding clutter to their homes.

The Android App connects via WiFi to obtain the highest quality music transmission and enable functions otherwise not possible like multi-room music control. BULB also uses Bluetooth to control lighting to provide functional independence and control regardless of WiFi signal.

BULB is a light bulb speaker that uses multi-colored LEDs to provide the consumer full color spectrum customizability at the tip of their fingers with our user-friendly app. Powered by SONOS PLAY:1 speakers, BULB delivers mind blowing sound with crisp highs and deep lows.

Our user-friendly app seamlessly controls every aspect of the device from music accessibility to full color spectrum customizability.
