

## ECE 178: Introduction (contd.)

Lecture Notes #2: January 9, 2002

- Section 2.4 –sampling and quantization
- Section 2.5 –relationship between pixels, connectivity analysis

Jan 9

W03/Lecture 2

1

## Announcements (01/09/02)

- Send your contact information and availability on Fridays for discussion sessions to Marco ASAP.
- 01/10/2003: Discussion session will be at WEBB 1100.
- Note that the HW#1 due on Jan 17.
- HW#2 will be due on Jan 24.
- Today:
  - Basic relationship between pixels (Section 2.5)
  - Image sampling and quantization (Section 2.4, notes)
  - A quick introduction to MATLAB
  - Linear systems review (time permitting)

### Sampling and Aliasing

Jan 9

W03/Lecture 2

14

### Additional Reading

- Chapter 1, Introduction
- Chapter 2, Sections 2.1-2.4
  - We will discuss sampling and quantization in detail later (Week 2)
- Next:
  - some basic relationships between pixels (Section 2.5)
  - MATLAB: an overview
  - A quick tour of linear systems (note, G&W additional reading)

Jan 9

W03/Lecture 2

15

### Relationship between pixels

- Neighbors of a pixel
  - 4-neighbors (N,S,W,E pixels) ==  $N_4(p)$ . A pixel  $p$  at coordinates  $(x,y)$  has four horizontal and four vertical neighbors:
    - $(x+1,y)$ ,  $(x-1,y)$ ,  $(x,y+1)$ ,  $(x,y-1)$
  - You can add the four diagonal neighbors to give the 8-neighbor set. Diagonal neighbors ==  $N_D(p)$ .
  - 8-neighbors: include diagonal pixels ==  $N_8(p)$ .

Jan 9

W03/Lecture 2

16

### Pixel Connectivity

Connectivity  $\rightarrow$  to trace contours, define object boundaries, segmentation.

In order for two pixels to be connected, they must be “neighbors” sharing a common property—satisfy some similarity criterion. For example, in a binary image with pixel values “0” and “1”, two neighboring pixels are said to be connected if they have the same value.

Let  $V$ : Set of gray level values used to define connectivity; e.g.,  $V=\{1\}$ .

Jan 9

W03/Lecture 2

17

### Connectivity-contd.

- 4-adjacency: Two pixels  $p$  and  $q$  with values in  $V$  are 4-adjacent if  $q$  is in the set  $N_4(p)$ .
- 8-adjacency:  $q$  is in the set  $N_8(p)$ .
- m-adjacency: Modification of 8-A to eliminate multiple connections.
  - $q$  is in  $N_4(p)$  or
  - $q$  in  $N_D(p)$  and  $N_4(p) \cap N_4(q)$  is empty.

Jan 9

W03/Lecture 2

18

## Connected components

- Let  $S$  represent a subset of pixels in an image.
- If  $p$  and  $q$  are in  $S$ ,  $p$  is connected to  $q$  in  $S$  if there is a path from  $p$  to  $q$  entirely in  $S$ .
- Connected component: Set of pixels in  $S$  that are connected; There can be more than one such set within a given  $S$ .

Jan 9

W03/Lecture 2

19

## 4-connected components

$p=0$ : no action;

$p=1$ : check  $r$  and  $t$ .

- both  $r$  and  $t = 0$ ; assign new label to  $p$ ;
- only one of  $r$  and  $t$  is a 1. assign that label to  $p$ ;
- both  $r$  and  $t$  are 1.
  - same label => assign it to  $p$ ;
  - different label=> assign one of them to  $p$  and establish equivalence between labels (they are the same.)

*Second pass over the image to merge equivalent labels.*

Jan 9

W03/Lecture 2

20

## Exercise

**Develop a similar algorithm for 8-connectivity.**

Jan 9

W03/Lecture 2

21

## Problems with 4- and 8-connectivity

- Neither method is satisfactory.
  - Why? A simple closed curve divides a plane into two simply connected regions.
  - However, neither 4-connectivity nor 8-connectivity can achieve this for discrete labelled components.
  - Give some examples..

Jan 9

W03/Lecture 2

22

## Related questions

- Can you "tile" a plane with a pentagon?

Jan 9

W03/Lecture 2

23

## Distance Measures

- What is a Distance Metric?

For pixels  $p, q$ , and  $z$ , with coordinates  $(x, y)$ ,  $(s, t)$ , and  $(u, v)$ , respectively:

$$D(p, q) \geq 0 \quad (D(p, q) = 0 \text{ iff } p = q)$$

$$D(p, q) = D(q, p)$$

$$D(p, z) \leq D(p, q) + D(q, z)$$

Jan 9

W03/Lecture 2

24

## Distance Measures

- Euclidean

$$D_e(p, q) = \sqrt{(x-s)^2 + (y-t)^2}$$

- City Block

$$D_4(p, q) = |x-s| + |y-t|$$

- Chessboard

$$D_8(p, q) = \max(|x-s|, |y-t|)$$

```
2 2 2 2 2
2 1 1 1 2
2 1 0 1 2
2 1 1 1 2
2 2 2 2 2
```
