

# Biology from an EE perspective

## Lecture 9

Chemical signaling at the cell surface

Rakesh K Lal

# Lecture Overview

- Chemical signaling very widely used in organisms
  - A large window to sensing the environment via chemicals
  - Widely used for communication between cells
  - Electrical signaling often terminated with chemical signaling
- Chemical signaling can be both proximal & remote
- Signaling paradigms
- Examples

Figure credits: Unless mentioned, all jpeg images are from the site of *Molecular Cell Biology* by Lodish et al., published by W H Freeman & Co

# Chemical signaling

- Used for homeostasis, for responding to environmental stimuli and for cell cycle control
- Some examples are:
  - Control of blood pressure by modulating blood vessel cross-section
  - Regulation of metabolic rates
  - Sensing and control of signaling for organ growth via cell division
  - Muscle contraction
  - Response to temperature shock

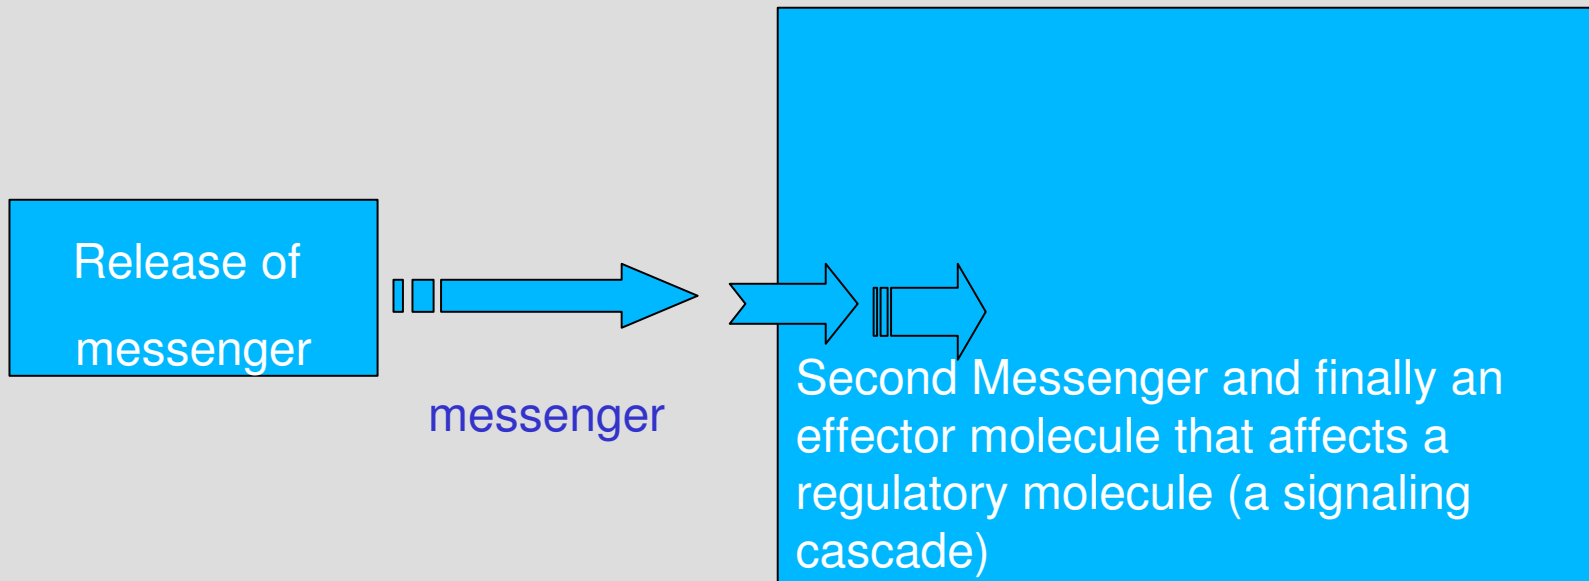

# Chemical signaling some possibilities

- Signaling can be short range
  - Autocrine: Signaling with target sites on the same cell (such as, cytokine interleukin1 in monocytes. growth factors released by certain tumor cells)
  - Paracrine: Signaling with target sites on cells in proximity neurotransmitters (such as, across a synapse)
- Signaling can be long range
  - Endocrine: Signaling with target sites on cells at a distance, such as in hormonal control in which the signaling molecules are normally carried by the blood

**How can one transfer a signal across a cell membrane?**

**Molecules should not be transported across!**

# Signaling process

Ligand → Receptor → Signal transduction

# Signaling process

- Signaling happens via a series of processes – is really a signaling cascade
  - Release of signaling molecule
  - Diffusion of the signaling molecule to a receptor and attachment to a receptor
  - Release of a second messenger within a cell
  - Trigger of some chemical process by the second messenger, such as activation or deactivation of an enzyme molecule or triggering an ion channel protein
  - Degradation or removal of the second messenger
  - Deactivation of the signal transduction protein
  - Desensitization of the receptor at high conc of signaling mol

# Possibilities

- Because of so many stages in the process, there are many possibilities
  - The same signaling molecule can target different receptor molecules – might have different affinity sites or the same site might be active
  - Some receptors can initiate action via more than one intracellular signaling pathway
    - Modulate ion-channels
    - Modulate activity of proteins
    - Modulate activity of protein synthesis (!)
    - Trigger protein expression

# Some messenger molecules

- Epinephrine
  - Heart – increase in rate and contraction strength
  - Smooth muscles – decrease in tension
  - Liver – increase in conversion of glycogen to glucose
- Acetylcholine
  - Muscle – contraction
  - Heart – decreases rate and force
  - Pancreas – induces insulin secretion

**Why different effects? Look at receptors & signaling cascades**

# Some effector molecules

# Receptor classes & signaling pathways -1

**TABLE 14-1** Overview of Major Receptor Classes and Signaling Pathways

Receptor Class/Pathway*	Distinguishing Characteristics
RECEPTORS LINKED TO TRIMERIC G PROTEINS	
G protein-coupled receptors (13)	<p><i>Ligands:</i> Epinephrine, glucagon, serotonin, vasopressin, ACTH, adenosine, and many others (mammals); odorant molecules, light; mating factors (yeast)</p> <p><i>Receptors:</i> Seven transmembrane <math>\alpha</math> helices; cytosolic domain associated with a membrane-tethered trimeric G protein</p> <p><i>Signal transduction:</i> (1) Second-messenger pathways involving cAMP or IP<sub>3</sub>/DAG; (2) linked ion channels; (3) MAP kinase pathway</p>

# Receptor classes & signaling pathways -2

**TABLE 14-1** Overview of Major Receptor Classes and Signaling Pathways

Receptor Class/Pathway*	Distinguishing Characteristics
RECEPTORS WITH INTRINSIC OR ASSOCIATED ENZYMATIC ACTIVITY	
TGFβ receptors (14, 15)	<i>Ligands:</i> Transforming growth factor β superfamily (TGFβ, BMPs), activin, inhibins (mammals); Dpp ( <i>Drosophila</i> ) <i>Receptors:</i> Intrinsic protein serine/threonine kinase activity in cytosolic domain (type I and II) <i>Signal transduction:</i> Direct activation of cytosolic Smad transcription factors
Cytokine receptors (14, 15)	<i>Ligands:</i> Interferons, erythropoietin, growth hormone, some interleukins (IL-2, IL-4), other cytokines <i>Receptors:</i> Single transmembrane α helix; conserved multi-β strand fold in extracellular domain; JAK kinase associated with intracellular domain <i>Signal transduction:</i> (1) Direct activation of cytosolic STAT transcription factors; (2) PI-3 kinase pathway; (3) IP <sub>3</sub> /DAG pathway; (4) Ras-MAP kinase pathway
Receptor tyrosine kinases (14)	<i>Ligands:</i> Insulin, epidermal growth factor (EGF), fibroblast growth factor (FGF), neurotrophins, other growth factors <i>Receptor:</i> Single transmembrane α helix; intrinsic protein tyrosine kinase activity in cytosolic domain <i>Signal transduction:</i> (1) Ras-MAP kinase pathway; (2) IP <sub>3</sub> /DAG pathway; (3) PI-3 kinase pathway
Receptor guanylyl cyclases (13)	<i>Ligands:</i> Atrial natriuretic factor and related peptide hormones <i>Receptor:</i> Single transmembrane α helix; intrinsic guanylate cyclase activity in cytosolic domain <i>Signal transduction:</i> Generation of cGMP
Receptor phosphotyrosine phosphatases	<i>Ligands:</i> Pleiotrophins, other protein hormones <i>Receptors:</i> Intrinsic phosphotyrosine phosphatase activity in cytosolic domain inhibited by ligand binding <i>Signal transduction:</i> Hydrolysis of activating phosphotyrosine residue on cytosolic protein tyrosine kinases
T-cell receptors	<i>Ligands:</i> Small peptides associated with major histocompatibility (MHC) proteins in the plasma membrane of macrophages and other antigen-presenting cells <i>Receptors:</i> Single transmembrane α helix; several protein kinases associated with cytosolic domain; found only on T lymphocytes <i>Signal transduction:</i> (1) Activation of cytosolic protein tyrosine kinases; (2) PI-3 kinase pathway; (3) IP <sub>3</sub> /DAG pathway; (4) Ras-MAP kinase pathway

# Receptor classes & signaling pathways -3

**TABLE 14-1** Overview of Major Receptor Classes and Signaling Pathways

Receptor Class/Pathway\*

Distinguishing Characteristics

RECEPTORS THAT ARE ION CHANNELS

Ligand-gated ion channels (7, 13)

*Ligands:* Neurotransmitters (e.g., acetylcholine, glutamate), cGMP, physical stimuli (e.g., touch, stretching), IP<sub>3</sub> (receptor in ER membrane)

*Receptors:* Four or five subunits with a homologous segment in each subunit lining the ion channel

*Signal transduction:* (1) Localized change in membrane potential due to ion influx, (2) elevation of cytosolic Ca<sup>2+</sup>

# Receptor classes & signaling pathways -4

**TABLE 14-1** Overview of Major Receptor Classes and Signaling Pathways

Receptor Class/Pathway*	Distinguishing Characteristics
INTRACELLULAR RECEPTORS PATHWAYS	
Nitric oxide pathway (13)	<i>Ligands:</i> Nitric oxide (NO) <i>Receptor:</i> Cytosolic guanylyl cyclase <i>Signal transduction:</i> Generation of cGMP
Nuclear receptor pathways (11)	<i>Ligands:</i> Lipophilic molecules including steroid hormones, thyroxine, retinoids, and fatty acids in mammals and ecdysone in <i>Drosophila</i> <i>Receptors:</i> Highly conserved DNA-binding domain, somewhat conserved hormone-binding domain, and a variable domain; located within nucleus or cytosol <i>Signal transduction:</i> Activation of receptor's transcription factor activity by ligand binding

\*Unless indicated otherwise, receptors are located in the plasma membrane. Numbers in parentheses indicate chapters in which a receptor/pathway is discussed in depth.

# Possibilities

# Organization of receptors

- Receptors often are areally localized and areally organized
- Sometimes both areally and spatially organized

# An example of how switching occurs

# G-protein

- Uses the GDP to GTP switch of state to activate an enzyme that catalyzes cyclic AMP for further signaling

# G-protein action -1

# G-protein action -2

Is the ligand affinity constant state dependent?

## G-protein action -3

- 5** Hydrolysis of GTP to GDP causes  $G_{\alpha}$  to dissociate from effector and reassociate with  $G_{\beta\gamma}$

# G-protein action

**1** Binding of hormone induces a conformational change in receptor

**2** Activated receptor binds to  $G_\alpha$  subunit

**3** Binding induces conformational change in  $G_\alpha$ ; bound GDP dissociates and is replaced by GTP;  $G_\alpha$  dissociates from  $G_{\beta\gamma}$

**4** Hormone dissociates from receptor;  $G_\alpha$  binds to effector, activating it

**5** Hydrolysis of GTP to GDP causes  $G_\alpha$  to dissociate from effector and reassociate with  $G_{\beta\gamma}$

# Other effector processes

# Phosphorylation based processes -2

# Control of gene expression

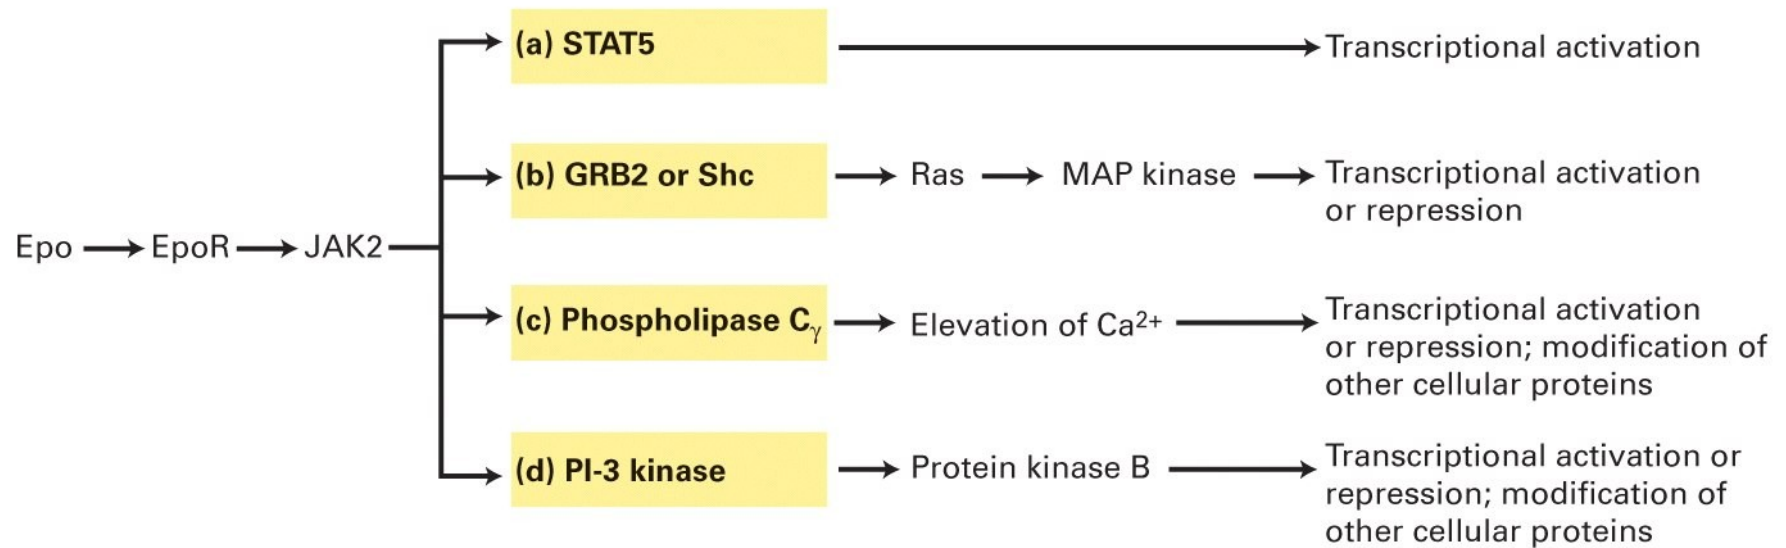

# Erythropoietin & red cell production

# Erythropoietin structure

# Different signaling cascades initiated by Epo

# Triggering transcription

# Signal blocking & protein degradation

(b) Signal blocking and protein degradation induced by SOCS proteins

Poly-ubiquitin based tagging & degradation of proteins

# Ras pathway -1

Why does phosphorylation happen?

# Ras pathway -2

# Ras pathway -3

# More complex cascade

# Effecting control

Should we look at mathematically modeling this?

# TAK1 & cell survival signaling

[Transforming growth factor  $\beta$ -activated kinase]

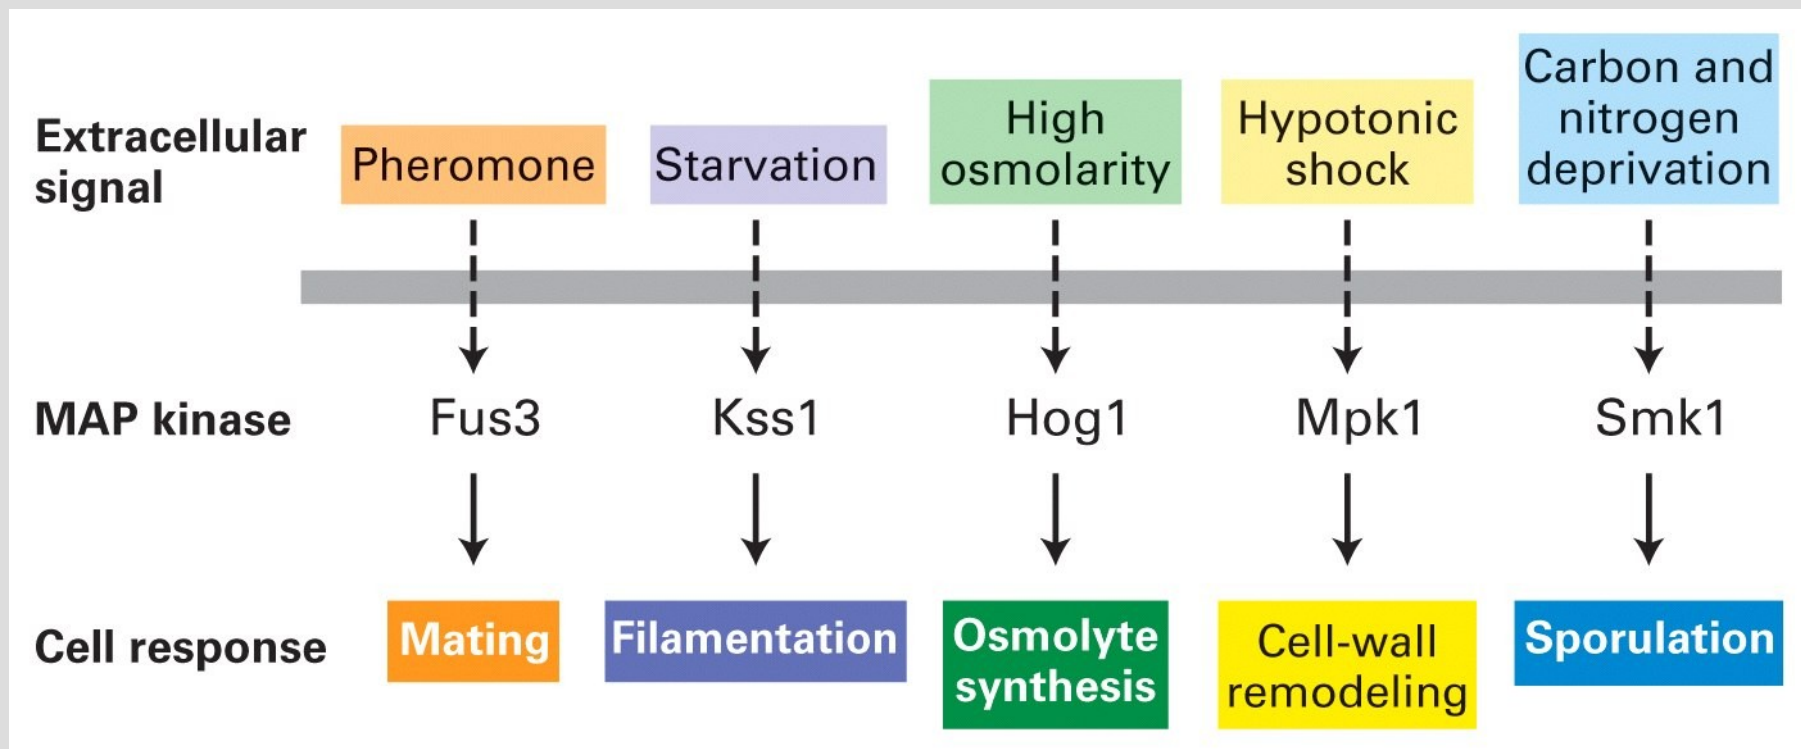

# Bone shaping – resorption here

What happens to the Ca?

# Responses of yeast to different stimuli

# Studies complex: Example rods

Expression of G protein-regulated phospholipase C (PLC)  $\beta 4$  controls activity of retinal signaling but not initial change of potential

# How studied

# Summary

- Chemical signaling a cascade of signals
  - First messenger binds to receptor --> Second messenger released or a conformation change leads to an effector modulating a regulatory molecule
- Few signaling motifs but enable many possibilities
- Could model a signaling cascade mathematically for fun
