Problem Statement

Uninterrupted connectivity for UGVs in disruptive environments

Application of Ultrawide Bandwidth

Relay nodes with radio module for stable communication

Project Overview

Remote-controlled LiDAR SLAM-capable robot with camera feed

Deploys RF and proximity aware nodes

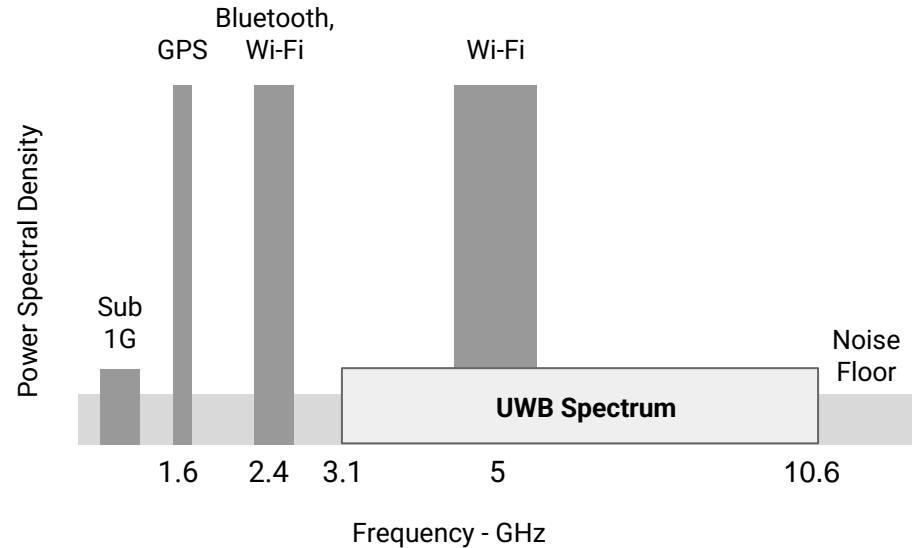

Uninterrupted connectivity in high-interference environments

Ultra-Wide Bandwidth

Uses narrow RF impulses

Frequency 3.1 GHz to 10.6 GHz

Bandwidth 500 MHz to 1.3 GHz

Why UWB?

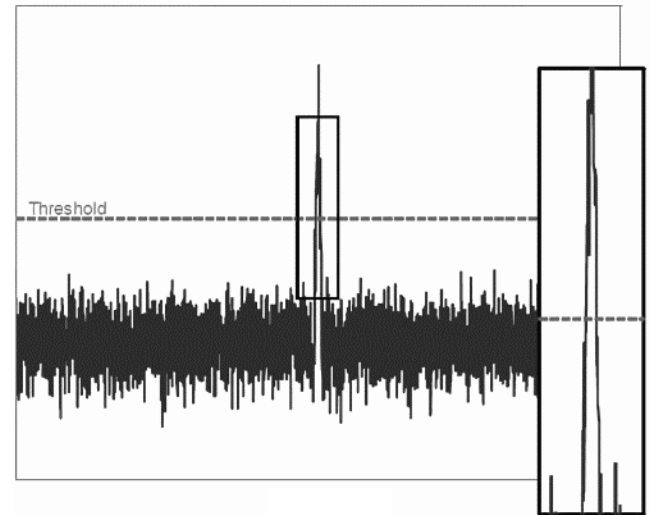

Low power and near noise floor

Resistance to multipath interference

Avoids commonly used frequencies

Data rates up to 27 Mbps

Ultrawide Bandwidth Signal vs Noise

Printed Circuit Board

Printed Circuit Board

4 Layers (2.5" x 2.5")

On-board RF module

Worked the 1st iteration!

DWM3000 (UWB Module)

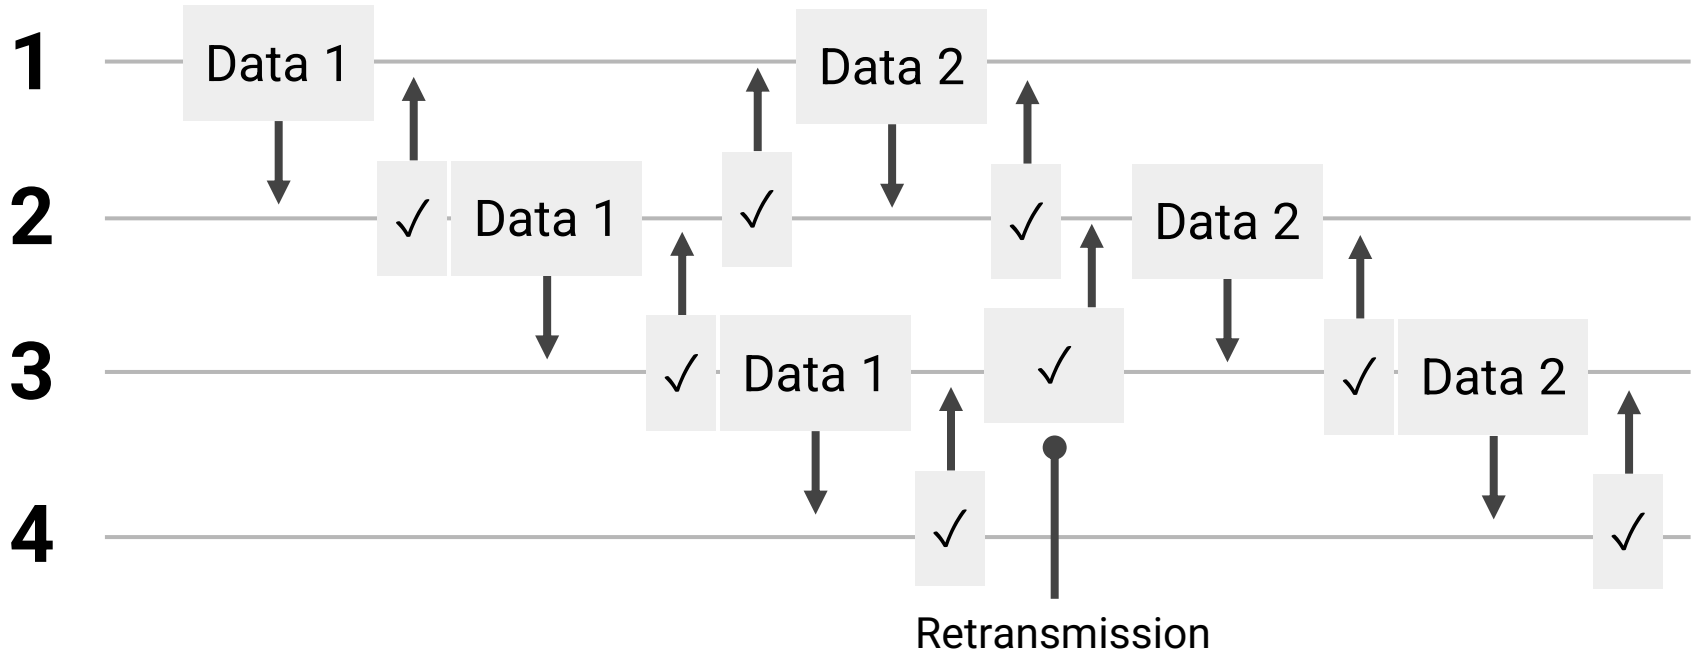

0.4 Inch Width, 0.9 Inch Height

Low Power, High Reliability

Released in 2020

Node Transmission Protocol

Serial Interface

Challenges

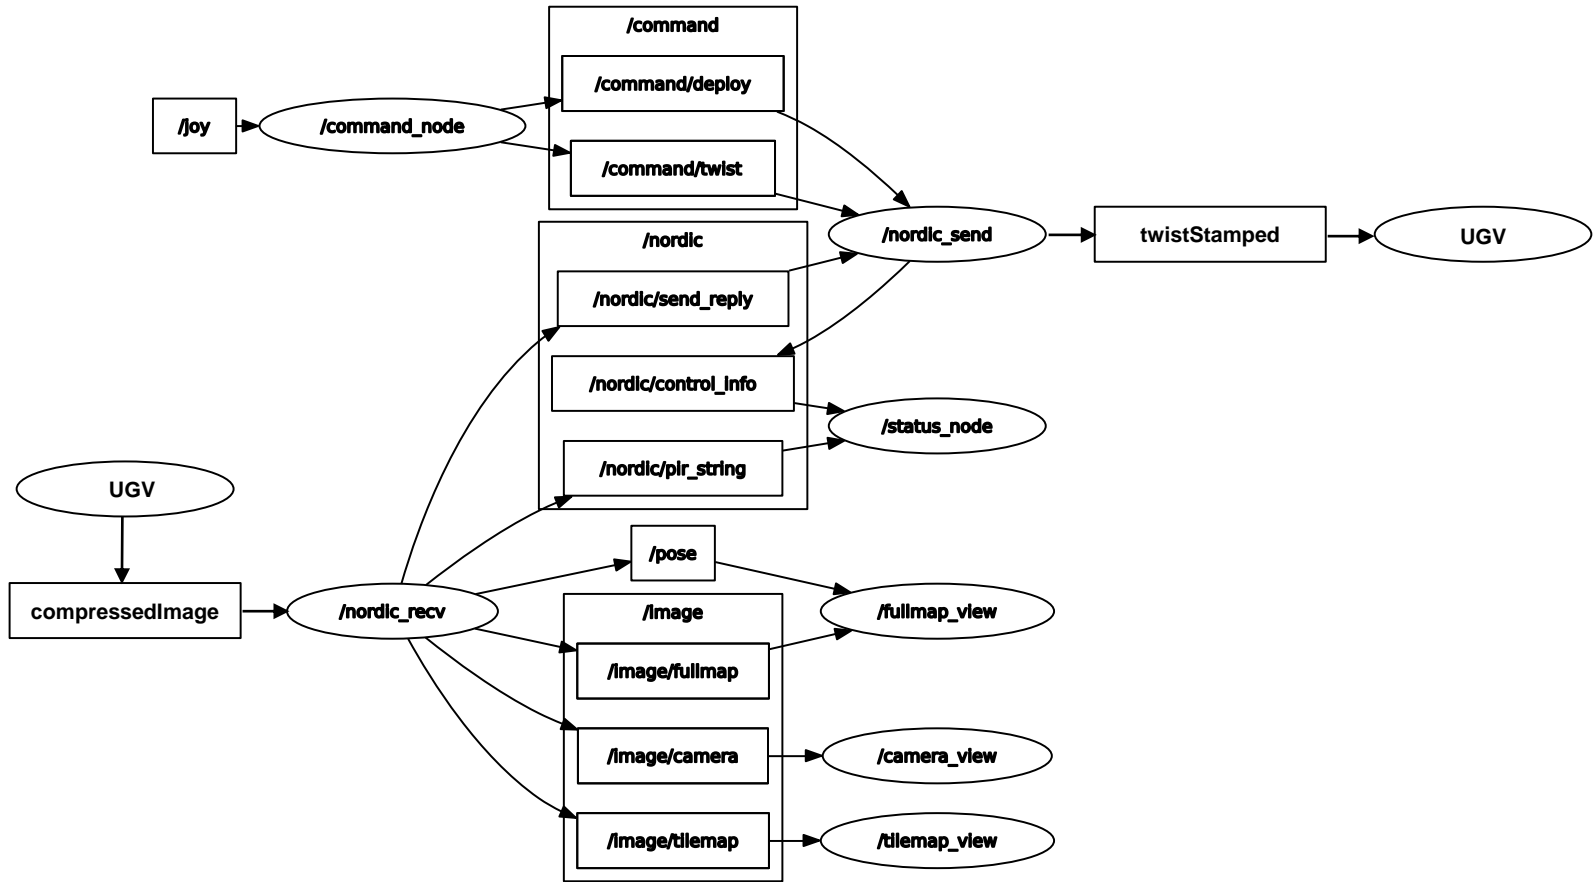

Node Coordination using Half-Duplex Communication

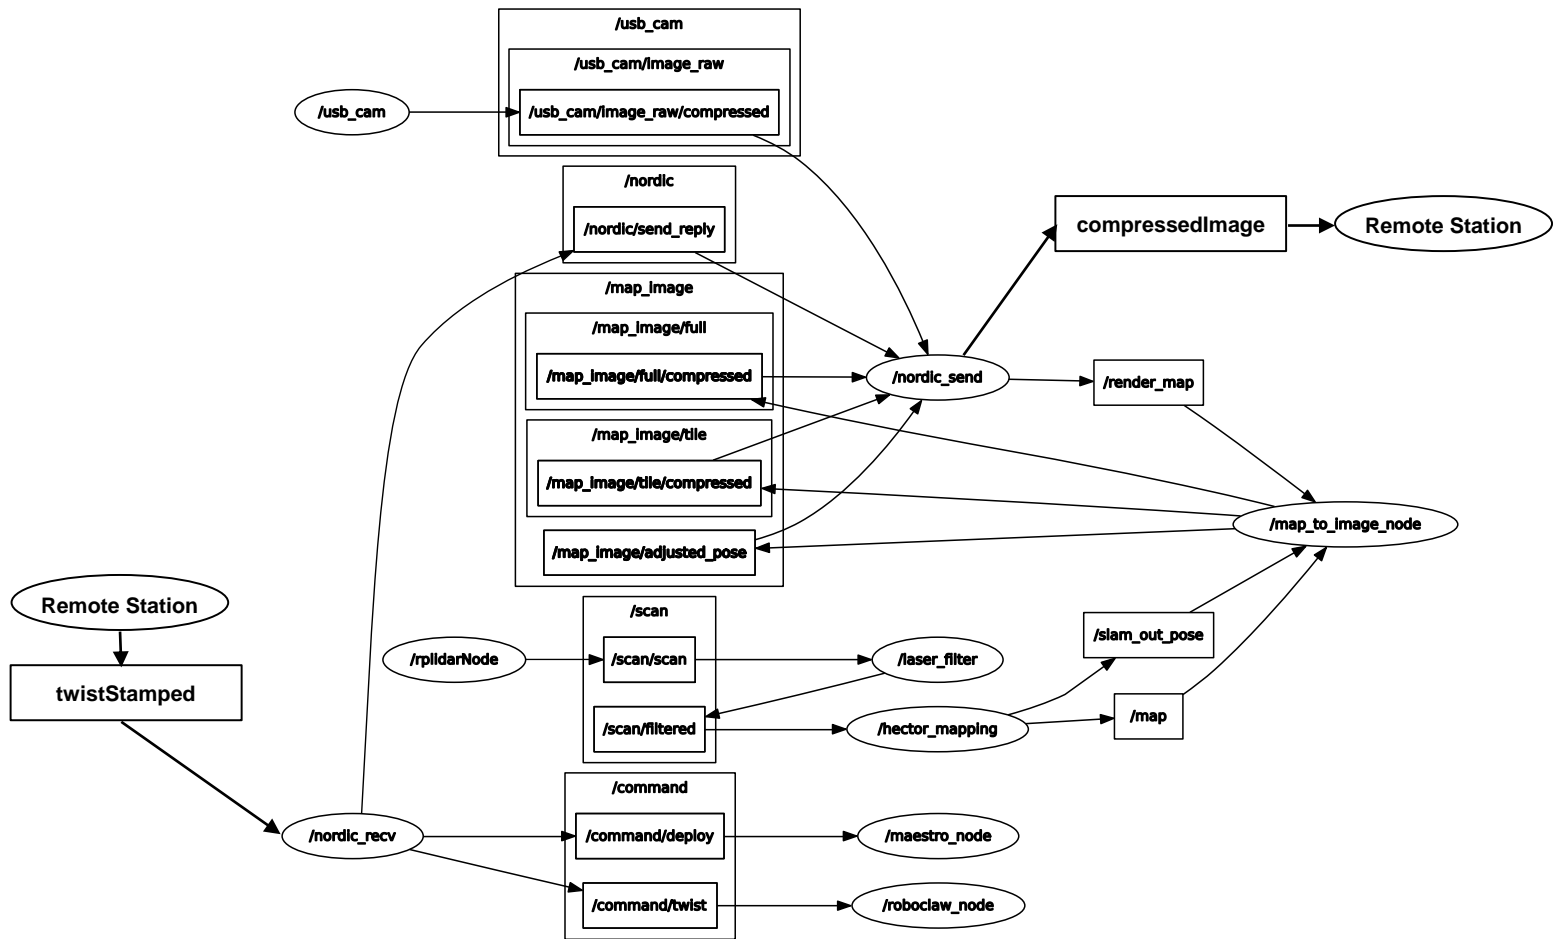

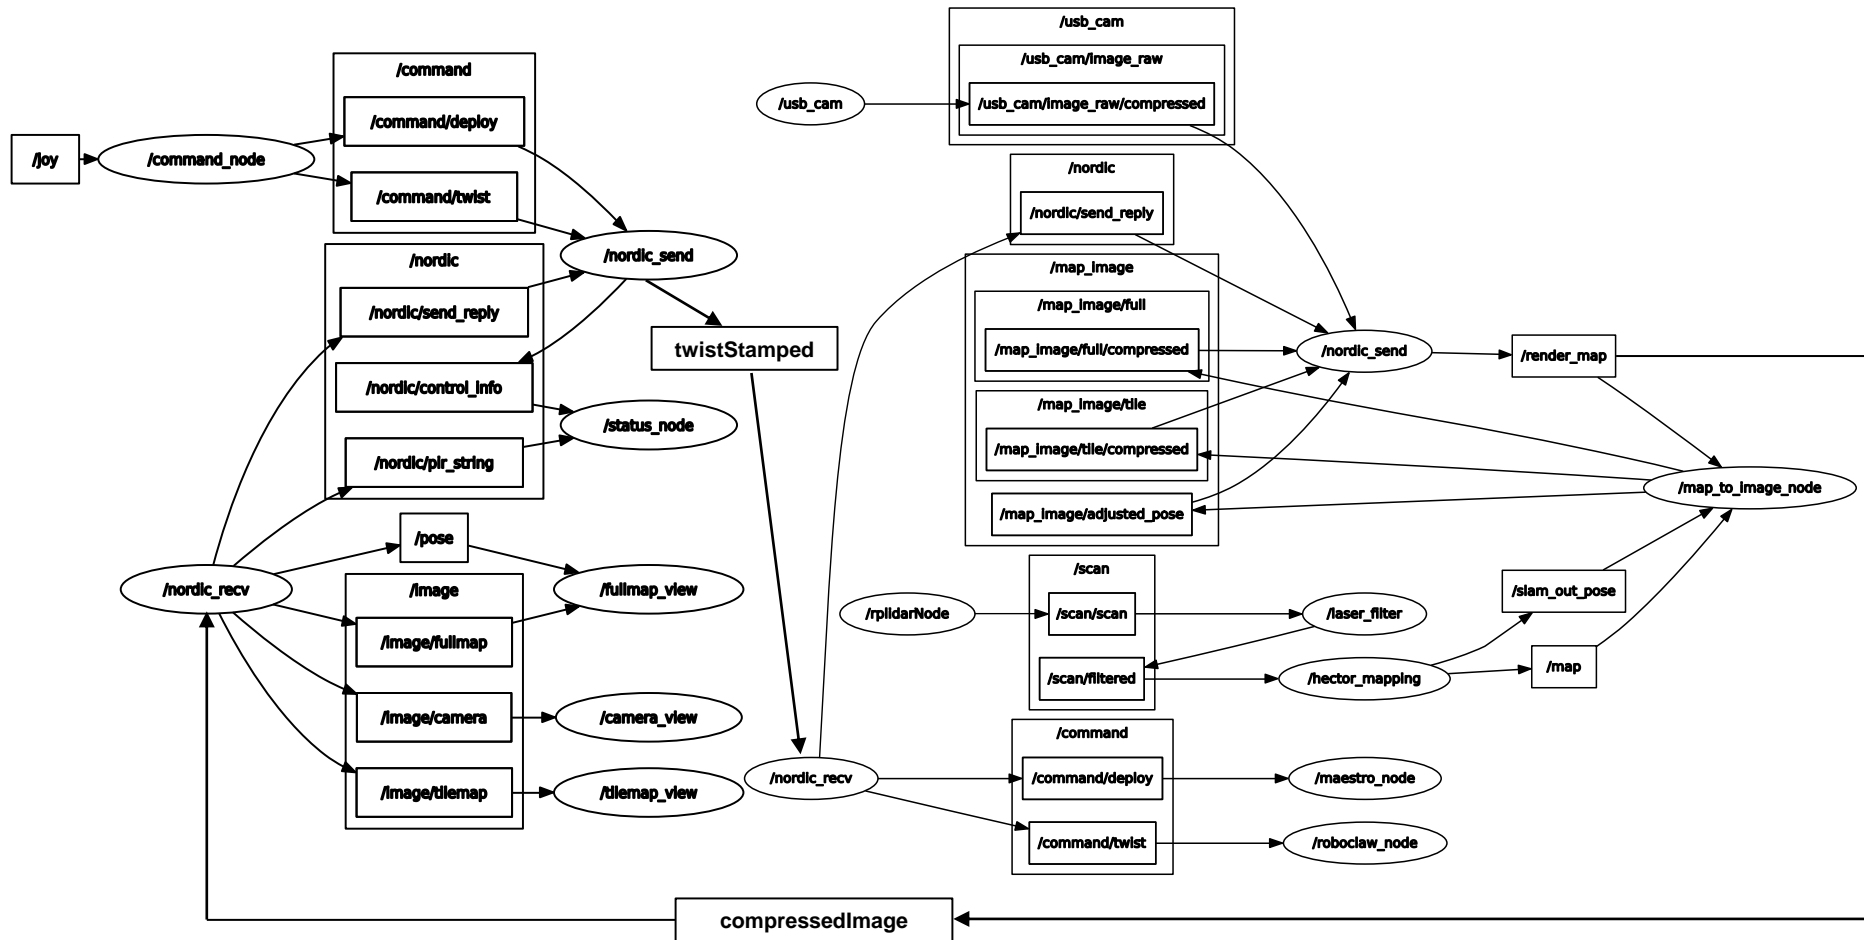

Speed vs. Reliability Tradeoff

ROS Implementation on UGV and Remote Station

Future Applications

- Multi-band OFDM UWB solution for IEEE 802.15.3a WPANs
- 802.15.4z Enhanced UWB PHY Layers and Associated Ranging
- Low Probability of Detection and Interception
