

Moisturizer maker

I'm proposing creating a moisturizer maker which takes 3 ingredients and analyzes the ingredients through the process by ensuring they are the correct temperature and adequate levels. Those will be monitored by the temperature and pressure sensor. The ingredients will be put into a container and the amount of each ingredient will be told by the computer to the STM32 microcontroller, and the STM32 microcontroller will control the valve. Once the ingredients are in the container they will be mixed together and that mixer will be controlled by another microcontroller.
